In the present study, mechanical properties and low cycle fatigue behavior of a solid-solutionized AA6061 aluminum alloy produced by equal channel angular pressing (ECAP) process were investigated. The grain refinement after two passes of ECAP significantly increased the yield stress and ultimate tensile stress and decreased the ductility of the alloy.

graded substrates is studied by Suresh et al., in normal and tangential loadings [9]. They proved that the contact stress can be calculated by punch deformation. Also non-frictional sliding contact with linear variation of material constants [10], [11] and normal contact for various coating material variations are modelled [12].
