OPTICAL DESIGN of OPHTHALMIC LENSES Introduction We tend to prescribe ophthalmic lenses as though any lens with the right back vertex power will do. Lens curves are not, however, chosen haphazardly. Just like a telescope, photographic objective, or any other optical device, ophthalmic lenses are designed to maximize performance. General Principles of Optical Design

Optical lens design is the process of designing a lens to meet a set of performance requirements and constraints, including cost and manufacturing limitations. Parameters include surface profile types, as well as radius of curvature, distance to the next surface, material type and optionally tilt and decenter. The process is computationally intensive, using ray tracing or other techniques to model how the lens affects light that passes through it.

Aspheric eyeglass lenses allow for crisper vision than standard "best form" lenses, mostly when looking in other directions than the lens optical center. Moreover, the reduction of the magnification effect of a lens may help with prescriptions that have different powers in the 2 eyes ( anisometropia ).
