Depending on how a preload is applied, the preloading methods can be subdivided into preloading using fill, preloading using vacuum pressure and combined fill, and vacuum preloading methods. In addition to preloading, PVDs have also been used for some other relatively new methods such as dynamic consolidation for clays.

Rigid preloads are obtained by applying a load with a precision locknut or clamping element that has faces machined flat and perpendicular to the axis. The nut applies an axial load to the inner or outer bearing ring, with the opposing side located against a shoulder on the shaft or housing.

Earth fills, water lowering, vacuum under impervious membrane are some of the techniques used for applying pre-load. Once the settlement under the pre load is completed, the preload is removed is removed and the construction of the structure is started.

BEARING PRELOAD ASSEMBLY METHODS Deadweight: A fixed weight is set against the bearing ring while adhesive cures to retain the bearings. This system is used in many applications, and gives well-controlled torque values as well as maximum stiffness. Disadvantages are cure time and special handling of adhesive in mass-production.

used in a number of countries for land reclamation and soil improvement work (Holtz, 1975; Chen and Bao, 1983; Choa, 1990; Jacob et al., 1994; Bergado et al., 1998; Chu et al., 2000). Sand drains and, more recently, prefabricated vertical drains (PVDs) have often been used to distribute vacuum load and discharge pore water.

“Still another method for fixed constraint preloading is axial adjustment. This method requires great care, accuracy, proper tooling and cleanliness during the assembly process to avoid excessive preloading and ensure correct conditions. First, two bearings are mounted with the desired axial offset. The shaft and/or housing are threaded.
