The equation for calculating total resistance in a parallel circuit (for any number of parallel resistances) is sometimes written like this:  $R_{total} = (R_1^{-1} + R_2^{-1} + \dots + R_n^{-1})^{-1}$  Re-write this equation in such a way that it no longer contains any exponents.

### Parallel Circuit Problems And Solutions

The simplest approach to analyzing a series-parallel circuit is to resolve each purely series group into its single equivalent resistance and to resolve each parallel group of resistors into its equivalent resistance. The process is repeated as many times as necessary.

A circuit breaker in series before the parallel branches can prevent overloads by automatically opening the circuit. A 15 A circuit operating at 120 V consumes 1,800 W of total power.  $P = VI = (120 \text{ V})(15 \text{ A}) = 1,800 \text{ W}$ . Total power in a parallel circuit is the sum of the power consumed on the individual branches.

One of the simplest and most useful things we can do in a circuit is to reduce the complexity by combining similar elements that have series or parallel connections. Resistors, voltage sources, and current sources can all be combined and replaced with equivalents in the right circumstances. We start with resistors.

Solution: As the link resistance between the terminals a-b is zero, hence, the link is practically a short circuiting link and the current through the link is assumed to be 1 s.c. Let us now first take the 50V source. The circuit configuration for this case is shown in figure 5.

$1/Z = \sqrt{1/R^2 + (1/XL - 1/XC)^2}$   $1/Z = \sqrt{1/R^2 + (1/XL - 1/XC)^2}$  Equation 2 can be used to find the equivalent impedance of the three components in parallel. The circuit current can also be found this way by dividing the applied voltage by Z or by directly multiplying  $1/Z$  by the applied voltage.

Solving parallel circuits is an easy process once you know the basic formulas and principles. When two or more resistors are connected side by side the current can "choose" it's path (in much the same way as cars tend to change lanes and drive alongside one another when a one-lane road splits into two parallel lanes).
