The valence electrons are the electrons in the outermost principal energy level. They are always s and p- electrons. Since the total number of electrons possible in s and p sublevels is eight, there can be no more than eight valence electrons. Determine the number of valence electrons in the atoms below. 1. Fluorine 2. Phosphorus 3. Calcium 4.

In the case of a roller coaster, the stored energy is called "gravitational potential energy," since it is the force of gravity that will convert the potential energy into other forms. The amount of gravitational energy can be calculated from the mass of the object (m , in kg), the height of the object (h , in m), and the gravitational constant ($g = 9.8 \text{ m/s}^2$).

Potential energy is stored energy and has the capability to become working energy. When the car is released, the potential energy is turned into kinetic energy (the energy of motion) as gravity pulls the car and passengers back down to the earth. However, no matter what an object weighs, all objects fall at the same rate*.

Radial distribution function for the Lennard-Jones model fluid at $\rho^* = \rho^*$, $\rho^* = \dots$. In statistical mechanics, the radial distribution function, (or pair correlation function) ($g(r)$) in a system of particles (atoms, molecules, colloids, etc.), describes how density varies as a function of distance from a reference particle.. If a given particle is taken to be at the origin O , and if ρ is the average ...
